

Example units with the strongest ethanol-induced change in sniff phase-locking (top k=5 by $|\Delta\text{MRL}|$)

Selection criterion: the k=5 units with the largest $|\text{delta_MRL}| = |\text{MRL_ethanol} - \text{MRL_control}|$ across all included units and sessions (RESULT-delta-mrl, OD-2). Probe-location panels: plot_unit_locations(D) for that unit's session, highlighted (red circle) at the example unit's own depth/shank from RESULT-unit-locations.

DEV-001 WARNING: All 5 top- $|\text{delta_MRL}|$ examples in this figure come from session 2021-11-03, which has degenerate control-condition MRL values (see DEV-001, 08_traceability/deviations.yaml): 374/429 included units have 0 control-condition spikes (MRL_control undefined) and most of the rest have only 1-4 control spikes, making a pooled MRL_control of ~ 0.914 for this session a near-single-spike artifact, not a reliable phase-locking estimate. These examples should not be presented as typical or representative without explicit acknowledgement of this limitation.
