

Ethanol vs control phase-locking of OB units to the SNF signal -- experiment (animal) level

A. Animal-level mean MRL, paired

B. Per-animal ethanol vs control mean MRL

$n_{\text{experiments}} = 6$ (up to 6); 2021-11-03 is included via the PROH-002 eth_threshold adjustment (OD-3). Paired Wilcoxon exact two-sided test: $p = 0.03125$, matched-pairs rank-biserial $r = -1.000$.
 * DEV-001 (08_traceability/deviations.yaml): 2021-11-03 has degenerate control-condition MRL values (0-4 control spikes for most included units); its animal-level mean_mrl_control (≈ 0.914) is a near-single-spike artifact, not a reliable phase-locking estimate -- flagged in red and requires human review before use.
