

Ethanol vs control phase-locking of OB units to the SNF signal -- unit level

Mixed-effects (condition fixed, animal random intercept)
exact p = 7.511e-220
coefficient = -0.2367
standardized effect size = -1.026

Per-unit MRL

n_units = 1138 (matched ethanol+control pairs entering the mixed-effects model; n_animals = 6). 465 of 1603 units with a computed ethanol-condition MRL are excluded from this plot and from RESULT-stat-unit because they have no valid control-condition MRL (0 control-condition spikes), overwhelmingly from the DEV-001-flagged 2021-11-03 session. Unit inclusion: overall firing rate ≥ 0.1 Hz AND ≥ 50 valid-sniff spikes combined across ethanol + control conditions. Mixed-effects condition fixed-effect exact p = 7.511e-220, standardized effect size (coefficient / residual SD) = -1.026. Diamond markers = mean $\pm$ SE; thick lines = median.
