

Figure 1C-bottom / 1E analogue (KEY): LFP-sniff coherence spectrum per depth with null threshold

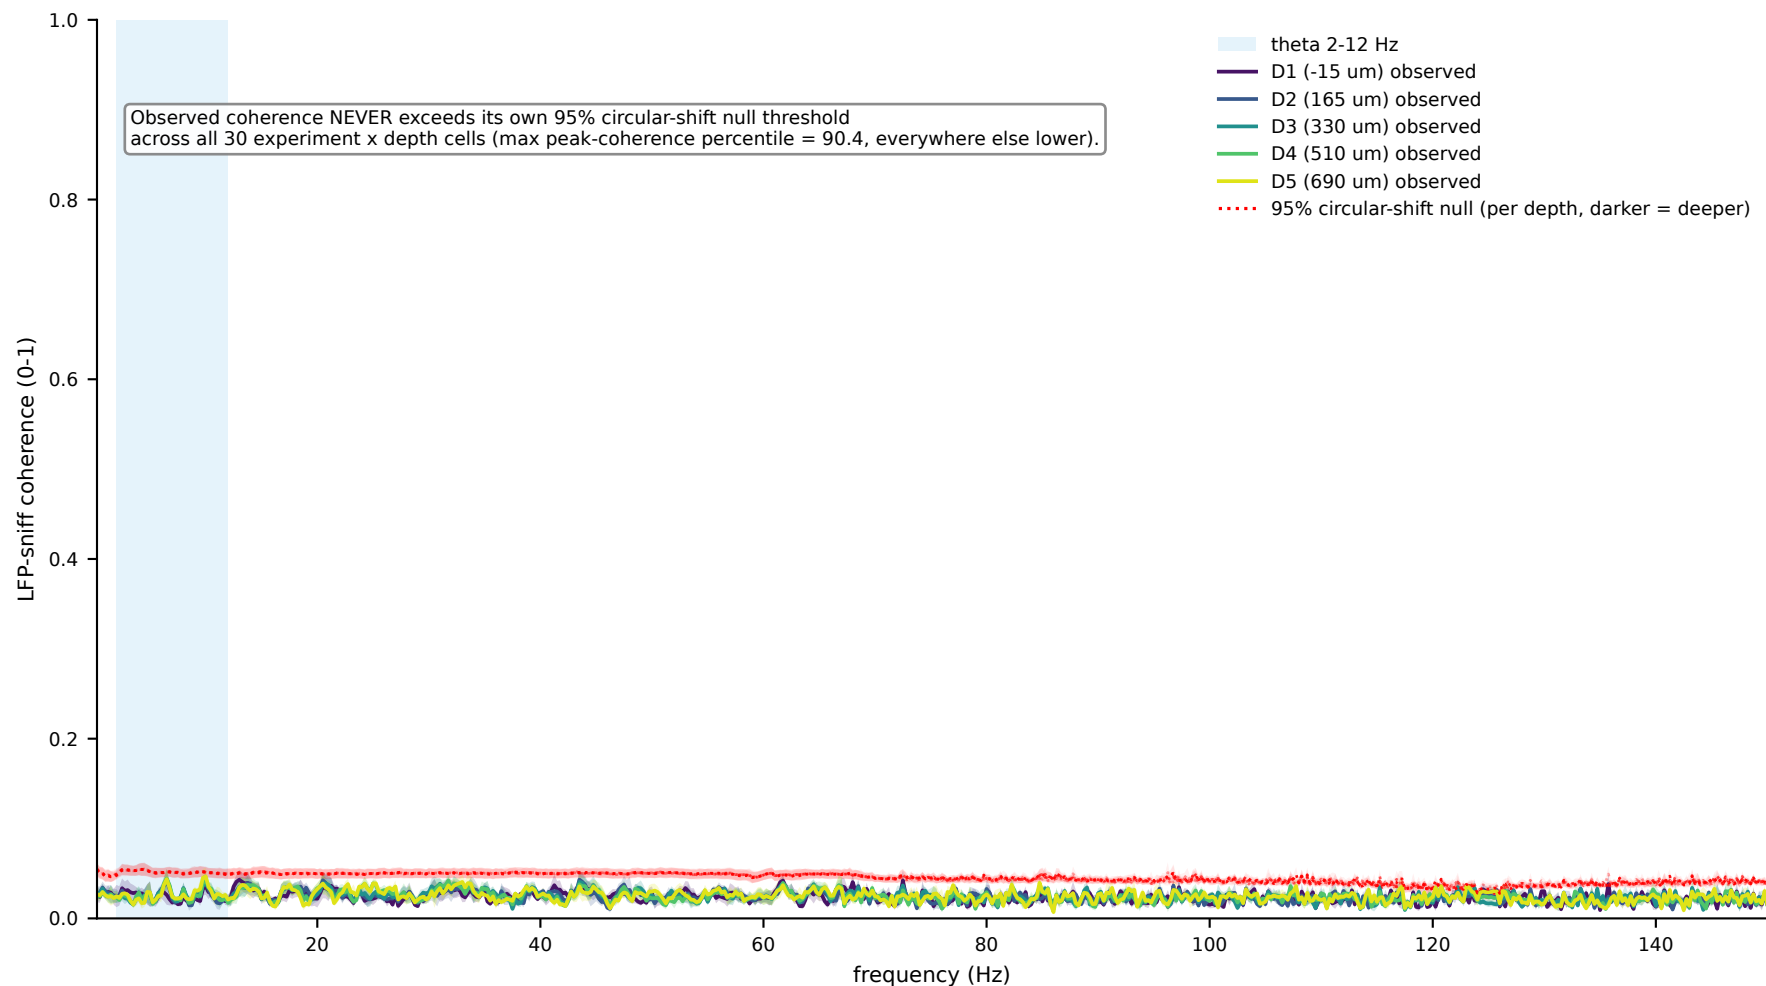

Figure 1C-bottom / 1E analogue (KEY): LFP-sniff coherence spectrum per depth with 95% circular-shift null (≥ 1000 shifts, seed 5489, red dotted; per depth, grand mean $\pm$ SEM across $n_{\text{experiments}}=5$ animals) shown on the SAME axes as the observed coherence (grand mean $\pm$ SEM across the same $n_{\text{experiments}}=5$ animals). Theta band (2-12 Hz) shaded. Depth ordinals 1-5 (tip $\rightarrow$ surface); legend states channel ycoord (um). Y-axis spans the full 0-1 coherence range (not truncated). Across all 30 experiment x depth cells, the observed coherence never reaches the 95% null threshold (max peak-coherence percentile = 90.4). Frequency axis cropped to 0.25-150 Hz for display; underlying data extend to 500 Hz (Nyquist).
